

Day 2

Day 2 is here and I completed Chapter 2, “Variables, expressions, and statements” today.

- Variables – a name that refers to any value

E.g.: `a = 3` (a is variable here)

The naming convention of variables

- Can contain both letters and numbers
 - Cannot begin with a number
 - Should be include space between multiple words (use of ‘`_`’ instead)
 - Should not use keywords (such as: `for`, `class`, `if`)
- Expressions – a combination of variables, operators, and values
E.g.: `1 + 3`
 - Statements – a section of code that represents a command or action.
E.g.: `print("Hello, World!")`

Other basic terminologies are:

- comment – ignores the code and does not affect the program. Used for documentation (`#` helps to comment code in python)

These are one of the most basic terms I got to know about today. Solved the exercises provided in this chapter and it was fun overall. All right, see you tomorrow. PEACE
